Jurisdiction selection/search [Also will be fixed at bottom of page]

Grouping the out of work population in [Selected jurisdiction]

The user will be able to hover/tap these sections to view more on the underlying cluster. Note that the divisions here represent detailed clusters, which nest under superclusters

xx%

The bottom ribbon would be the nationwide distribution of superclusters [Is this necessary? Could we facilitate this comparison in another way?]
Build intuition for who is included here. We won't use personas at the local level. The challenge with allowing the user to select individual clusters is that to this point we've only dealt with the superclusters. [There's also no obvious way to select superclusters.]

We need some way to tie the selection back to the superclusters discussed above. We could do that here by showing: 1) You've selected cluster A, 2) It is part of the supercluster B ("young, low education"), and this population would benefit most from industry or bridge programs.

Reuse the program recommendation indicator.

I C **B** T S

Data for the selected cluster. Visualization format is to be determined. The goal of the visual is to understand the characteristics of the selected cluster and to benchmark it against the overall 25-64 y/o pop. in all jurisdictions. **If no cluster is selected**, data is presented for the overall 25-64 y/o pop. in the jurisdiction.

Age

Map(s)

If no cluster is selected, then the mapping module will show small multiples, depicting the geographic distribution of people by supercluster.

Otherwise, if a **user selects a cluster**, one map will show the geographic distribution of people within that cluster
